| \$F\$18 | Dummy Supply Total | 3 | -1520 | 3 | 9 | 0 |

- To minimize cost, Mount Street Bets should buy 10 bags from Blurberry and 8 from Louie Mutton, 2 belts from Louie Mutton and 9 from Walenciaga, and 10 pairs of shoes from Versaycee, 10 from Gnocci, and 1 from Walenciaga. This will leave 3 pairs of shoes to be purchased, which can't be [purchased with the given demand constraints.
- We cannot know exactly how this will affect the optimal solution cost and number of bags purchased because it goes outside of our allowable increase range which is \$80. Our solution will change but we will need to resolve.
- To account for these changes, we will need to set a constraint that at least as many Louie Mutton bags must be purchased as Louie Mutton belts, expressed as: $X_{BELM} \leq X_{BALM}$
- To represent this initial cost, we will need to add a binary decision variable (Z) with a \$1000 cost, representing whether we purchase anything from Walenciaga. Each Walenciaga variable (X_{iWA}) will then be multiplied by Z to determine whether any of those products are able to be purchased.
- Mount Street Bets will be looking to buy three more pairs of shoes and will be willing to pay up to \$100 per pair.

2.

a.

b. We do expect the formulation to give us naturally integer solutions because the lower and upper bounds of our decision variables are integer constrained.

c. *I put \$5 as the selling price of preordered packs so that my solution would represent the profit earned from everything else*

- The best decision if the Forum is optimistic is D1 (large ship).
- The best decision if the Forum is pessimistic is D3 (online only).
- The best decision if the Forum wants to minimize their maximum regret is D1 (large ship) with a maximum regret of \$8,000.
- The best decision is to go with D1 which gives an expected profit of \$39,700 (as shown below).

- h. They should choose D1 because it has the highest expected utility of at 60,808 (calculations shown below).

$$\begin{aligned}
 E[U(\pi(D1))] &= 0.9(U(42,000)) + 0.1(U(19,000)) \\
 &= 0.9(64,932) + 0.1(23,692) \\
 &= 58,438.8 + 2,369.2 \\
 &= 60,808 \\
 E[U(\pi(D2))] &= 0.8(U(31,000)) + 0.2(U(21,000)) \\
 &= 0.8(43,493) + 0.2(26,733) \\
 &= 34,794.4 + 5,346.2 \\
 &= 40,140.6 \\
 E[U(\pi(D3))] &= U(27,000) \\
 &= 36,477
 \end{aligned}$$

- i. Our CEV will be 40,003.92 (working shown below)

$$\begin{aligned}
 U(\pi) &= 1.3(0.00001\pi^2) + \pi \\
 60,808 &= 1.3(0.00001\pi^2) + \pi \\
 0 &= 0.000013\pi^2 + \pi - 60,808 \\
 \pi &= \frac{-1 \pm \sqrt{1^2 - 4(0.000013)(-60,808)}}{0.000026} \\
 \pi &= \frac{-1 \pm \sqrt{1 + 3.162}}{0.000026} \\
 \pi &= \frac{-1 + 2.0401}{0.000026} \\
 \pi &= \frac{1.0401}{0.000026} \\
 \pi &= 40,003.92
 \end{aligned}$$
